Board slotting is the least invasive, and possibly the strongest way of rehinging detached boards, the most common failure of book structures. Christopher Clarkson invented the technique in the late 70's, and until now there was no affordable, ready to use machine available. The Peachey Board Slotting Machine is the first machine made in the USA available for sales worldwide. It is also the only board slotting machine to have an automatic feed, which dramatically reduces tedium and operator errors.

In board slotting, an angled slot is cut into the spine edge of a board to the precise thickness of the hinging material--often laminated linen or cotton and tissue. The slot does not disturb the turn-ins, the pastedown or the covering material. When the hinging material is inserted, the thickness of the board is maintained, eliminating unsightly creases that can arise with traditional

rebacking. It is also much faster than traditional rebacking. It is an extremely useful machine for a wide variety of book structures.

The Peachey Board Slotting Machine comes complete with a variety of saw blades, safety guards, an integrated dust collection slot, automatic feed, and detailed instructions. The automatic feed keeps hands at a safe distance from the blade and allows for extremely precise placement.

For additional specifications and a free instructional DVD showing the machine in action, please contact Jeffrey Peachey.

COST: NORTH AMERICA \$6,900.00

WORLDWIDE \$7,050.00

Two to three day workshops are also available.
